

**PROTECT PUBLIC  
HEALTH**

*Weed killers, fertilizers and animal waste that are deposited on your lawn can backflow into your drinking water from your lawn irrigation system. To protect your drinking water from potential contamination, it is important to have an approved backflow protection assembly on your irrigation system. These systems do prevent contaminated water from siphoning back into your home plumbing and the city water system. A lawn irrigation system not protected by an approved backflow assembly endangers the health of a household, neighborhood and community.*
